

ABSTRACT OF THE DISCLOSURE

In a mobile phone system including plural base stations for transmitting logical control channel signals through transmission slots to which the same slot number in one frame is allocated, and a mobile phone for receiving the logical control channel signals through a reception slot to which the slot number corresponding to the transmission slots having the same slot number in the one frame is allocated, according to a handover method, each of the base stations transmits the logical control signal through the transmission slot to which the same slot number in the one frame is allocated, and the mobile phone sets to a receivable state the reception slot to which the slot number corresponding to that of the transmission slot used when each of the plural base stations transmits the logical control channel is allocated, whereby the logical channel signal is received through the reception slot which is set to the receivable state, thereby performing handover.
